factor of 5.3 percent, but it may keep any earnings it can achieve. Inflation is assumed to be 3.3 percent annually in this illustration. Therefore the price cap index declines 2.0 percent each year. This is the rate by which the hypothetical carrier must reduce its telephone rates.

The illustration continues by assuming that the carrier actually achieves a 5.3 percent productivity and thus earns 13.65 percent each year. However, the rate of return, whatever it is, has no bearing on the movement of the price cap index.

There are three reasons why the argument illustrated by Figure 2 is wrong, and why video dialtone cross-subsidies <u>do</u> affect telephone ratepayers. The three reasons relate to (1) jurisdictional separations, (2) interstate profitability, and (3) industry productivity.

1. Jurisdictional Separations

By law, the FCC must separate the costs of telephony between interstate and intrastate services. At present, there is no formal recognition of video dialtone services in the Part 36 separations rules. To date the allocation of costs for video dialtone are following the allocations contained in the LECs' proposed video dialtone tariffs. If these proposed tariffs understate the cost of video dialtone, they overstate the cost of telephone services. Existing separations procedures (Part 36) allocate approximately 75 percent of telephone service costs to

the intrastate jurisdiction. Thus, each \$1.00 overstatement of telephone costs by reason of video dialtone cross-subsidies inflates intrastate jurisdictional costs by 75¢.

Whether or not a carrier chooses the no sharing "pure" price cap option for interstate services has absolutely no effect on intrastate ratemaking. The only way to protect intrastate telephone ratepayers from paying for video dialtone subsidies is to ensure that intrastate telephone costs do not include video dialtone costs. To address this issue, the Commission should revise its Part 64 accounting rules to separate all video dialtone costs from telephone costs before these costs are separated by jurisdiction. This will ensure that no video dialtone costs will be supported by intrastate telephone ratepayers.

2. Interstate Profitability

According to LEC tariff filings, the provision of video dialtone service in the initial years will increase costs more than revenues. This early unprofitability will influence the LECs' choice of price cap options. As discussed above, the "pure" price cap option requires a 5.3 percent productivity offset and results in an annual rate reduction of 2.0 percent. However, if the carrier anticipates that video dialtone will lower its overall profits, it will not opt for the "pure" price cap option, but will choose one of the "sharing" options that does not carry such a high productivity offset. The carrier will opt for the price cap option

which minimizes its total rate reduction requirement as a result of both the formula and sharing. The carrier will choose the lowest productivity offset available, unless this choice will cause it to lower rates more through sharing than it avoids by choosing a low productivity offset.

In Figure 3, it is assumed that the carrier initially earns 13.65 percent, which is above the 12.25 threshold for sharing under the two sharing options. However, consistent with the data from LEC tariffs, Figure 3 assumes that video dialtone costs reduce realized productivity by 3.0 percent to 2.3 percent. This drop in productivity will cause lower earnings. Anticipating this, the carrier will choose the 4.0 percent productivity factor, the lowest price cap productivity option. This choice produces a net annual price reduction of only 0.7 percent. Under this option, the carrier must share earnings between 12.25 and 13.25 percent on a 50/50 basis, and it must refund all earnings greater than 13.25 percent. In this illustration, video dialtone service has reduced the carrier's return to 12.80 percent. Therefore, deprives the carrier of only .275 percent 1 of its earnings in the first year. In the second and third years, video dialtone further depresses earnings to 11.95 percent and 11.10 percent, respectively, so the carrier shares no earnings whatever.

Since carriers choose one of the three price cap options each

 $^{^{1}12.808-12.258 = .558 \}times 508 = .2758$

year, the advent of video dialtone will likely result in a migration of LECs from the highest productivity, non-sharing option to the lower productivity, sharing options. As demonstrated by the first three years of Figure 3, the effect on ratepayers is an annual price cap adjustment that is 1.3 percentage points higher with video dialtone than without it.

The Commission can insulate interstate telephone ratepayers from this effect by imposing procedures to exclude video dialtone revenues and costs from the earnings that are used to compute the sharing obligation. However, if there is a cross-subsidy, and a portion for the common costs that should be assigned to video dialtone are assigned to telephone services, this exclusion fails to resolve the problem. Telephone service earnings will decline, and carriers will opt for the lower price caps in the confidence that they will not become subject to earnings sharing.

(,

3. Industry Productivity

In its recent price cap order, the Commission found merit in basing the productivity offset in its price cap mechanism on a moving 5-year average of the industry's productivity performance. The effect of adding significant new video dialtone inputs without a corresponding (in the near term) increase in outputs will be to reduce the industry's productivity performance. The moving average of productivity performance will decline, and with it the productivity offset.

The consequence of this effect is illustrated in Figure 3 in Years 4, 5, and 6. Figure 3 assumes that in Year 4 the Commission observes that the industry's productivity performance has fallen to 2.3 percent and the productivity offset is set at this level. Combined with an inflation rate of 3.3 percent, this offset allows an annual increase in rates of 1.0 percent, instead of the 2.0 percent decrease discussed above.

Again, the Commission can insulate telephone ratepayers from this effect by imposing procedures to exclude video dialtone inputs and outputs from the annual productivity performance (calculation. However, if there are cross-subsidies, and video dialtone costs are allowed to inflate telephony inputs, then the telephone productivity factor will decline in spite of the Commission's efforts to segregate these two lines of business for purposes of rate regulation.

Conclusion

In the attached illustration, the cumulative six-year effect of video dialtone on interstate telephone ratepayer is an increase of 12.9 percent in their rates. With no video dialtone costs, rates fall by 12.0 percent, as shown on Figure 2. With video dialtone costs, rates increase by 0.9 percent. This is in spite of the fact that the hypothetical LEC began, in Year 0, as a "pure" price cap carrier. Moreover, even if the FCC changes its existing price cap plan by eliminating the sharing options altogether, the

adverse effects of cross subsidy from improper cost allocation will persist. This is because the telephone productivity factor will be deflated as described above. Ultimately, without reasonable cost allocations, interstate and intrastate telephone ratepayers will bear the burden of supporting those cross-subsidies.
